# TWO FREE SETS.
# ONE PHRASE EACH.

**You do three things.** Your AI agent, Claude or Codex, installs what the sets need and builds both from your video: a movik and the editor screen it plays in.

**2**
finished videos from one clip

# THREE THINGS TO DO

## 1 GET CLAUDE OR CODEX

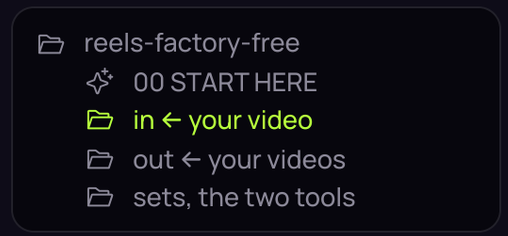
Either one works: the folder carries the same rules for both. **Claude**: download the app and sign in. **Codex**: download the app and sign in with your ChatGPT account.

**Claude: claude.ai/download**

**Codex: openai.com/codex**

## 2 UNZIP, ADD A VIDEO

Double-click **reels-factory-free.zip** and move the folder somewhere you keep your work. On Windows, put it straight on drive C, as **C:\reels-factory-free**. Put one video into its **in** folder, twenty seconds or more with a person in it works best. The results appear in **out**.



## 3 HAND IT TO THE AGENT

In Claude, open **Code**; in Codex, start a new local task. Choose the **reels-factory-free** folder, the one with 00 START HERE inside, then paste this and press Enter:

> Get these free Reels Factory sets ready on this computer, then build both from the video in the in folder.

The agent asks before it runs a command or goes online. Allow it: everything it installs stays inside this folder.

# WHAT YOU GET

## A MOVIK

The recipe of our first movik on your video: a punch-in drop, words behind the hero, money rain, mosaic with a rewind, 3D cards, shatter and captions in Anton. 42 seconds, vertical.

## THE EDITOR SCREEN

The desktop editor Reels Factory is promoted with: agent cursors cutting one timeline, your clip in the pool, your movik in the program window. 2880 by 1800.

# WANT TEN FROM ONE?

These two are two of the ten reel types. The full Reels Factory builds all ten from one video, with voice, subtitles and covers, checks every file before you see it, and grows with you: new effects, new types, your own brand.

# IF SOMETHING LOOKS STUCK

**The agent keeps asking for permission**

That is how Claude and Codex work with files, commands and the network on your computer. Allow each one, or allow them for the whole session. Everything happens inside this folder.

**The editor screen takes long**

It renders a 2880 by 1800 desktop frame by frame in a headless browser: 15 to 30 minutes on a laptop, and the first run downloads that browser once. The movik takes about four.

**Something failed during setup**

Tell the agent "keep going". The setup names the cause of every failure, and the agent fixes it and runs the step again.

**I want to know how they work**

Each set has its own README inside the sets folder, with every option: your own title, the words behind the hero, captions and music.
